APPENDIX G. GLOSSARY

#### APPENDIX A: DEFINITIONS OF FOREST HEALTH

A desired state of forest health is a condition where biotic and abiotic influences on the forest (for example, pests, atmospheric deposition, silvicultural treatments, and harvesting practices) do not threaten resource management objectives now or in the future. (USFS current definition; from forest health strategic plan)

A condition wherein a forest has the capacity across the landscape for renewal, for recovery from a wide range of disturbances, and from retention of its ecological resiliency while meeting current and future needs of people for desired levels of values, uses, products, and services. (USFS pending replacement def.)

A desired state of forest health is a condition where biotic and abiotic influences on the forests (e.g. pests, atmospheric deposition, silvicultural treatments, and harvesting practices) do not threaten current or future resource management objectives of options. (The Role of "Salvage" Harvesting in the Restoration and Maintenance of Healthy Forests. Society of American Foresters position statement)

A forest condition that has overall structure, function, and characteristics that enable it to be resilient to disturbance and to maintain normal rates of change commensurate with its stage of development. (Soc. of Am. Foresters, Silviculture Terminology)

A condition of forest ecosystems that sustains their complexity while providing for human needs. (O'Laughlin, et al., In Assessing forest health in the Inland West, Sampson and Adams, eds.)

"Ecosystem health is an *idea* comprising a class of phenomena. It is a symbol for a complex set of ecological realities, rather than a condition that can be measured or monitored directly." ..." ... health describes the preferred state of sites modified by human activity." (Steedman, Robert J. Ecosystem health as a management goal)

"Forests can be considered healthy when there is an appropriate balance between growth and mortality. Having the resilience to react and overcome various stressors is a key indicator o health, and is a key objective of ecosystem management." (Soc. of Am. Foresters, Sustaining Long-Term Forest Health and Productivity)

"Health is the capacity of the land for self-renewal." (Leopold, 1949)

Forest health can be defined as the ability of a forest to recover from natural and human-caused stressors. (USDA Forest Service 1993, In O'Laughlin, Exploring the definitions of forest health, 1993).

#### APPENDIX

Forest Health is a term defining the relative capacity of a forest to sustain values while maintaining integrity as a system, without human intervention. (Helms, John A. 1993).

#### APPENDIX

# **APPENDIX B: FIGURES**

# **CHARACTERISTICS OF FORESTS IN THE UNITED STATES**

Unless otherwise stated, data is from Powell et al. 1993. Figures do not account for recent changes (e.g., Northwest Forest Plan of 1993).

B-1	Changes in stand structures following disturbances
B-2	Regions of the United States referred to in this paper
B-3	Changes in mortality by region & ownership, 1952-1992
B-4	Volume/acre by diameter class for different regions, 1992
B-5	Changes in standing tree volume in each region, 1952-1992
B-6	Volume by diameter class, species group, & region, 1991
B-7	Changes in hardwood & conifer volumes by regions, 1952-1992
B-8	Changes in volumes by diameter classes by regions, 1952-1992
B-9	Changes in volumes by diameter classes by regions, 1987-1992
B-10	Changes in hardwood & conifer volumes by region, 1987-1992
B-11	Areas burned annually by wildfires in the western United States
B-12	Rate of harvest & mortality compared to gross growth by regions
B-13	Standing tree volume by tree condition & species group
B-14	Forest area change, 1952-1992
B-15	Changes in volume for selected species by region, 1962-1992
B-16	Changes in hardwoods & conifers by regions, 1952-1992
B-17	Areas in selected forest types in East & West
B-18	Ownership of productive forests by regions
B-19	Carbon dioxide released to produce construction wood or
	equivalents
B-20	Rural and urban population change, 1940-1990
B-21	Urban and rural populations by regions

#### APPENDIX

# **APPENDIX C: TABLES**

# **CHARACTERISTICS OF FORESTS IN THE UNITED STATES**

Unless otherwise stated, data is from Powell et al. 1993. Figures do not account for recent changes (e.g., Northwest Forest Plan of 1993). For definitions of terms, see footnotes in Tables 1, 3, & 4.

C-1	Forest land area characteristics by regions
C-2	Forest land area characteristics by region (percentages)
C-3	Characteristics of forests by regions (volumes of trees)
C-4	Per acre characteristics of forests by regions
C-5	Changes in forest volume (growing stock) by regions
C-6	Forest productivity & potential for increases in timber production
C-7	Conifer & hardwood volume by region & ownership
C-8	Changes in volumes by region & ownership
C-9	Characteristics of volume changes by regions & ownerships
C-10	Mortality by region, ownership, & per acre
C-11	Characteristics of population, wood production, & consumption
C-12	Potential for increases in employment in forestry & products
C-13	Some threatened and endangered forest species in each region
C-14	Partial estimate of recreation area in each region
C-15	Comparison of United States & world forests & timber consumption

APPENDIX C: INFORMATION TABLES SHOWING FOREST CONDITIONS IN THE UNITED STATES. Unless otherwise noted, data is from Powell et al. 1993. Data varies by method of collection. See table 3 for some various definitions.

TABLE C-1. FOREST LAND AREA CHARACTERISTICS BY REGIONS (circa 1992). (unless otherwise stated, from Powell et al. 1993; data in millions of acres)

	NORTH	SOUTH	INLAND WEST	PACIFIC COAST	ALASKA	ALL REGIONS
Total Land Area	414	535	742	208	365	2263

Nonindustrial private	71%	70%	28%	24%	41%	59%

<sup>2</sup> Forest land capable of growing over 20 cubic feet/acre/year of trees under natural conditions.

<sup>3</sup> Productive forests not administratively or legislatively withdrawn from active timber management.

<sup>4</sup> Productive forests administratively or legislatively withdrawn from active timber management.

TABLE C-3. CHARACTERISTICS OF THE FORESTS BY REGION (Powell et al. 1993; billion cubic feet). Growth and harvest can be expressed in many ways (e.g., removals, harvest, total volume and growing stock, net and gross growth, etc.). Several ways of expressing it are described below.

	NORTH	SOUTH	INLAND WEST	PACIFIC COAST	ALASKA	ALL REGIONS
Volume (billion cubic feet)						
Cull living trees <sup>1</sup>	23	23	6	3	1	56
Sound dead trees <sup>2</sup>	3	1	8	3	1	16
Growing stock <sup>3</sup>						
Total	207	251	110	213	35	817
Hardwood	156	148	9	19	4	336
Softwood	51	103	101	195	31	481
Total volume	233	275	124	219	38	889
Annual growing stock change(billion cubic	feet, growin	g stock)				
Gross growth <sup>4</sup>	6.9	12.0	2.9	4.8	0.5	27.1
Mortality	1.6	2.2	0.7	8.0	0.2	5.5
Net growth <sup>5</sup>	5.4	9.8	2.2	4.0	0.3	21.6
Removals <sup>6</sup>	2.8	9.0	0.8	3.5	0.2	16.3
Harvest	2.3	7.6	0.7	3.2	0.2	14.0
Net annual gain	2.6	0.9	1.3	0.5	0.0	5.3
Non-growing stock harvest <sup>7</sup>						
(billion cubic feet)	2	1	0	1	0	4
Standing growing stock/total volume	89%	91%	89%	98%	94%	92%
Growing stock harvest/total harvest <sup>8</sup>	56%	88%	80%	80%	97%	78%
Growing stock harvest/removals	83%	85%	90%	91%	75%	86%
Total harvest/removals	149%	96%	113%	115%	78%	110%
Gross growing stock changes						
Harvest/gross growth	33%	63%	26%	67%	38%	52%
Removals/gross growth	40%	74%	29%	73%	50%	60%
Mortality/gross growth	23%	18%	24%	17%	43%	20%
Net growing stock changes						
Harvest/net growth	43%	77%	34%	80%	67%	65%
Removals/net growth	52%	91%	38%	88%	89%	75%
Mortality/net growth	29%	22%	32%	20%	76%	25%

<sup>1</sup> Living trees >5 inches diameter not useful for sawlogs because of rot, roughness, or species.

<sup>2</sup> Net volume in salvageable dead trees.

<sup>3</sup> Live trees of commercial species meeting specific standards of quality & vigor.

<sup>4</sup> Increase in growing stock, not subtracting mortality.

<sup>5</sup> Net increase if growing stock after mortality (but not harvest or other removals) have been subtracted.

<sup>6</sup> Timber volume harvested & utilized or otherwise killed by weeding, land clearing, etc.

<sup>7</sup> Includes salvage of dead trees, small trees, non-commercial species, and nonforest land.

<sup>8</sup> Total harvest = harvest of both growing stock and non-growing stock

TABLE C-4.	PER ACRE CI	HARACTERISTICS	OF THE FOR	ESTS BY REG	ION.
(From Pow	vell et al. 1993.	See Table C-3 for	information re	. footnotes 3 th	rough 6.)

## APPENDIX D: BACKGROUND

## The Forestry Issues

Concerns about how our forests are managed have existed for hundreds of years. Forest management policies have emerged both directly from conscious decisions by policymakers and indirectly as unintended consequences of various legislation, technology changes, population shifts, economic changes, and others.

The past decade has seen increasing concern that the forests are not achieving the many values people desire of them. The results of laws, administrative actions, court rulings, and business behavior have led to confused "de facto" forest policies.

## Forest Health

Immediate concern for some objectives has led to the term "forest health", as a way to cover a range of issues; however, the term itself has become controversial since it has been defined and redefined to meet different objectives.

## Forest Health Science Committee

The Honorable Charles H. Taylor, United States Congress, 11th District of North Carolina, assembled a group of scientists, primarily from academia, with the attempt to avoid industrial, government (e.g. Forest Service), or lobbying influences. His stated objectives, through a series of questions, was to educate himself and others on the forest science basis of the issues. His expressed hope was to achieve a bipartisan understanding and resolution on the forestry issues and to provide specific proposals to policymakers which will form a more consistent, explicit forest policy (as opposed to the present "de facto" policy).

Congressman Taylor began the panel with a series of questions; however, once the panel was assembled, he has given it free reign to alter the questions and approach. His involvement has been primarily to facilitate and make visible the work of the panel. Consultation of the panel with him has primarily been to inform him of the findings and to get advice on the best ways to present the results for ease of understanding (e.g., matrix VS "bullet" approaches). His stated approach has been to trust that the science will lead to an understanding, and so the best chance for resolution.

## Approach of the Panel

The panel has taken a management science approach of policy analysis. We have attempted to separate the analysis of conditions and alternatives from value judgments. The former is the role of the panel, the latter is the role of policymakers.

The objectives of the panel are to clarify the conditions of the forests, the alternative approaches to managing them, the tradeoffs/consequences of the

different approaches, and specific steps which can be taken to achieve the desired approach.

To fulfill its objectives, the panelists have exchanged written papers, e-mail, regular mail, Fax's, phone calls, and conference calls. They have met several times and given public presentations of the panel's approach and findings, followed by input from the audience. The panel will continue to seek public input.

The panel is dividing its work into "white papers." The intended papers cover the topics:

- 1. "Forest health"? What does it mean, and why is it important?
- 2. What is the present condition of our forests relative to these values?
- 3. What are the factors which enable the forests to achieve or not achieve the various values?
- 4. What are the alternative approaches to managing our forests?
- 5. What specific factors could be changed, and how, to achieve the alternative approaches?

The approach of the panel has been to gain an understanding of each topic. Where there was any question or difference of opinion raised among the panel members or at any meeting, the questions and/or differences were resolved by examining information.

## APPENDIX E. BIOGRAPHIC INFORMATION OF PANEL MEMBERS

David L. Adams, Ph.D., Professor, College of Forestry, Wildlife and Range Sciences, University of Idaho, Moscow, ID.

Professor Adams earned is B.S. degree in Forest Management at Oklahoma State University, M.F. in Forest Mensuration at the University of Idaho, and his Ph.D. in Silviculture at Colorado State University. He worked in timber management with the USDA Forest Service, and held teaching and research positions at Colorado State University, Humboldt State University, and the University of Idaho where he also served for 15 years as chair of the Forest Resources Department. He has been at the University of Idaho for 25 years and currently teaches and does research in silviculture.

Professor Adams is a Fellow in the Society of American Foresters and has held several local, regional and national offices. His forest health emphasis includes serving as the University of Idaho representative on a regional Forest Health Partnership, as co-editor of Assessing Forest Health in the Inland West, and as an author of Forest Health Conditions in Idaho. Professor Adams has testified on forest health before US House and State of Idaho Senate committees, served on a international panel to advise the State of Alaska on forest health issues.

Thomas M. Bonnicksen, Ph.D., Professor, Department of Forest Science, College of Agriculture and Life Sciences, Texas A&M University, College Station, Texas.

Professor Bonnicksen earned his B.S. in Forestry, his M.S. in Forest Ecology, and his Ph.D. in Forest Policy (with distinction) in Wildland Resource Science from the University of California-Berkeley. He is professor of Forest and Environmental Policy in the Department of Forest Science and a former department head at Texas A&M University. He joined Texas A&M after serving as an assistant and associate professor of Forest Policy at the University of Wisconsin-Madison. He is co-founder of the Society for Ecological Restoration and a former member of its board of directors. He also held posts as president, chairman and vice-chairman of several other organization, including the Bay Area Chapter of the Sierra Club and the Southwest Wisconsin Chapter of the Society of America Foresters.

Professor Bonnicksen served four years on the California State Park and Recreation Commission and wrote the legislation that guides the classification and management of California's state park system. He also is a former National Park Service ranger. He has served as expert witness, and presented invited testimony on resource issues before state legislative committees, county governments and several committees of

the US House of Representatives and the US Senate. He has received awards from IM, the National Park Service, the California Resources Agency and the University of California-Berkeley.

Professor Bonnicksen has published 87 scientific and technical papers, articles, book chapters and other publications, and 6 computer programs. He served as guest editor and member of the editorial boards of several scientific journals, and his is currently an associate editor for Restoration Ecology. His research and consultancies over the last 24 years have focused on forest restoration and computer-aided group decision-making to resolve environmental issues.

Jim L. Bowyer, Ph.D., Director, Forest Products Management Development Institute, Department of Wood and Paper Science, University of Minnesota, St. Paul, MN

Dr. Jim L. Bowyer is a specialist in life cycle environmental analysis of materials and global raw material trends. He previously served as Head of the U of M Department of Wood and Paper Science. Dr. Bowyer received a B.S. degree in Forestry from Oklahoma State University, a M.S. degree in Forest Products from Michigan State University, and a Ph.D. in Wood Science and Technology from the University of Minnesota. He has served as President of the Forest Products Society, President of the Society of Wood Science and Technology, and is a Fellow of the International Academy of Wood Science.

Dr. Bowyer is chairman of the steering committee of the Consortium for Research on Renewable Industrial Materials, a member of the Board of Directors of the Tropical Forest Foundation, and a member of the Scientific Advisory Board of the Temperate Forest Foundation. He also serves on the Rocky Mountain Institute Systems Group on Forests.

Dr. Bowyer has authored over 100 articles dealing with various aspects of forest products production and use, and is co-author of the leading introductory wood science textbook in North America. He is a frequent speaker on these and related topics ,and on the subject of environmental aspects of forestry, timber harvest, and wood use.

Frederick W. Cubbage, Ph.D., Professor and Head, Department of Forestry, North Carolina State University, Raleigh, NC

Professor Cubbage earned his B.S. in Forestry from Iowa State University, M.S. in Forest Policy and Ph.D. in Forest Economics from the University of Minnesota. In addition to heading the Department of Forestry, he performs research and teaches course work in forest policy and timber supply issues.

Professor Cubbage was project leader of the forest economics research work unit, Southeastern Forest Experiment Station, and assistant, associate and full professor at the University of Georgia School of Forest Resources. Prior to that he served as associate economist with the Southern Forest Experiment Station in New Orleans, and as a Service Forester in Kentucky.

Professor Cubbage has authored or co-authored about 200 publications on subjects that include forest policies and program evaluations, regulation of private forest landowners, timber supply modeling, and timber production and harvesting. He is senior author of the 1993 textbook, Forest Resource Policy, published by John Wiley. He has served as an officer in several research organizations, including the Society of American Foresters and the International Union of Forestry Research Organizations. he has been recognized in Who's Who in Science and Engineering and in Who's Who in the Southeast and Southwest.

Chadwick D. Oliver, Ph.D., Professor, silviculture/Ecology, College of Forest Resources, University of Washington, Seattle, WA

Professor Oliver earned his B.S. in Forestry at the University of the South, Sewanee, Tennessee, his M.F.S. and Ph.D. (in Silviculture) at Yale University School of Forestry and Environmental Studies, New Haven, CT. Prior to receiving his Ph.D., he was a Research Fellow at The Harvard Forest, Harvard University at Petersham, MA, and an instructor in Biology at Harvard University in Cambridge, MA.

Professor Oliver's research during the 1970s and 1980s focused on the basic understanding of how forests developed and how silviculture could be applied to ecological systems most effectively. Much of this work is incorporated in a book he wrote entitled Forest Stand Dynamics (1990, and update edition in 96) with former student as co-author. he has continued this work; during the past decade he has also examined how this understanding can help resolve scientific, technical, and management issues at the landscape and policy levels. He is currently working on landscape approaches to management and is involved in the technical tools, the policies, the management approaches, and the educational needs.

Professor Oliver was a member of the Science Panel at President Clifton's Forest Conference in 1993, has testified at United States Senate and House of Representatives Committee hearings, and has served on various scientific panels for the United States and Washington State executive and legislative branches of government.

Professor Oliver is the author of more than 75 scientific and technical papers on forest science subjects and has considerable experience advising public and private natural resource organizations I the United States and abroad. His work has taken him to all parts of the United States and to Canada Mexico, Turkey, Nepal, Japan, Sweden, Finland, Russia, Ecuador, Germany, and France.

Neil Sampson, MPA, Senior Fellow, American Forests, Washington, DC

Neil Sampson holds degrees from Harvard University and University of Idaho. He became a Senior Fellow with the Forest Policy Center after serving 11 years as the executive vice president of American Forests (formerly American Forestry Association). Prior to that, he served 6 years as executive vice president of the National Association of Conservation Districts and 16 years in a variety of positions with the USDA Soil Conservation Service (now National Resources Conservation Service) in Washington, DC and Idaho.

Mr. Samson's research and writing covers a wide range of natural resource topics, with hundreds of articles and book chapters in popular and scientific literature. He has written two books on soil conservation, and co-edited several books on natural resource topics. He is member of the Society of American Foresters and the Soil and Water Conservation Society, where he holds the degree of Fellow, and has been awarded that Society's highest honor--the Hugh Hammnond Bennett Award.

In addition to his work with the Forest Policy Center, he is president of the Sampson group, Inc., an Alexandria, Virginia consulting firm that specializes in helping clients identify common-sense solutions to natural resource challenges.

Scott E. Schlarbaum, Ph.D., Associate Professor, Forest Genetics, Department of Forestry, Wildlife and Fisheries, University of Tennessee, Knoxville, TN

Professor Schlarbaum earned his B.S. and Ph.D. degrees at the Colorado State University and his M.S. at the University of Nebraska. He is currently project leader of the University of Tennessee's Tree Improvement Program. He conducts research on breeding and testing methodologies with recent advances in clonal propagation, and biological control of exotic pests through breeding for genetic resistance. he was a postdoctoral research associate in the Department of Plant Pathology, Kansas State University previously.

Professor Schlarbaum has authored numerous articles in forest genetics, tree cytogenetics and tissue culture. He is currently an associate editor for Forest Genetics, leader of the IUFRO (International Union of Forestry Research Organizations) Cytogenetics Working Party, and serves on the Southern Forest Tree Improvement Committee and the USDA Crop Germplasm Advisory Committee for Woody Landscape Plants.

Professor Schlarbaum is a frequent speaker on exotic pest issues. He has advised the USDA-APHIS (Agricultural Pest and Health Inspection Service) on exotic pest issues and policies. He has published articles on the exotic pest problem in North America, the most prominent being a co-authored report entitled, "Fading Forests. North American trees and the threat of exotic pests" a Natural Resources Defense Council report.

Ross S. Whaley, Ph.D., President, SUNY - Environmental Science and Forestry, Syracuse, NY

Dr. Whaley served 6 years as chief economist for the USDA Forest Service and served in academic and administrative positions at the University of Massachusetts, Colorado State University and Utah State University. Dr. Whaley is a Fellow of the Society of American Foresters and served as its president in 1991. He also served on the Boards of the Pinchot Institute of Conservation Studies, the Au Sable Institute of Environmental Studies, and the Nature Conservancy.

Dr. Whaley has served on several gubernatorial commissions in the state of New York, including the Task Force on Forest Industry, Adirondack Commission, and Northern Forest Lands Task Force. Dr. Whaley's professional interests lie in the political economy of forest resource use and conservation.

Harry V. Wiant, Jr., President, Society of American Foresters, Morgantown, WV

Dr. Wiant retired in 196 from the faculty of West Virginia University, Division of Forestry. He earned his B.S. in Forest management at West Virginia University, M.F. in Silviculture, University of Georgia, and his Ph.D. in Forest Ecology from Yale University. He served on the faculty at the Stephen F. Austin State University and Humboldt State University. Prior t that he was a forester for the USDA Forest Service.

Dr. Wiant has received awards from West Virginia University and Humboldt State University, served as editor of Northern Journal of Applied Forestry and West Virginia Forestry Notes. He is registered professional forester in West Virginia, a certified SAF Forester, and has served on the West Virginia State Board of Registration for Foresters.

Dr. Wiant has served as chair or officer of the Society of American Foresters t the national level, Allegheny and Lufkin-Nacogdoches section and at the WVU chapter. He has authored 200 scientific publications and two books.
